The misery of upper respiratory symptoms:
There *is* relief for sufferers of rhinorrhea, nasal congestion, head stuffiness, lacrimation and itchy eyes/nose...

Deconamine® SR®

Sustained Release Capsules (chlorpheniramine maleate, 8 mg/*d*-pseudoephedrine HCl, 120 mg)

- ☐ Effective antihistamine/ decongestant combination
- ☐ Convenient BID dosage
- ☐ Available by prescription only

*Not recommended for children under 12.

Please see brief summary of prescribing information on next page.

Deconamine® SR
CAPSULES (chlorpheniramine maleate d-pseudoephedrine HCl)

Before prescribing, please see full prescribing information. A brief summary follows:
Description: Each sustained release, blue and yellow capsule contains:
chlorpheniramine maleate ..... 8 mg
d-pseudoephedrine hydrochloride ..... 120 mg
The capsules are designed to provide prolonged release of medication.
Clinical Pharmacology: Chlorpheniramine maleate antagonizes the physiological action of histamine by acting as an H_1 receptor blocking agent.
Pseudoephedrine is an orally active sympathomimetic amine and exerts a decongestant action on the nasal mucosa. It does this by vasoconstriction which results in reduction of tissue hyperemia, edema, nasal congestion and an increase in nasal airway patency. The vasoconstriction action of pseudoephedrine is similar to that of ephedrine. In the usual dose it has minimal vasopressor effects.
Indications: For relief of nasal congestion associated with the common cold, hay fever and other allergies, sinusitis, eustachian tube blockage, and vasomotor and allergic rhinitis.
Contraindications: Patients with severe hypertension, severe coronary artery disease and patients on MAO inhibitor therapy. Deconamine is also contraindicated in patients sensitive to antihistamines or sympathomimetic agents.
Warnings: Chlorpheniramine maleate should be used with extreme caution in patients with narrow angle glaucoma, stenosing peptic ulcer, pyloroduodenal obstruction, symptomatic prostatic hypertrophy, or bladder neck obstruction. Due to its mild atropine-like action, chlorpheniramine maleate should be used cautiously in patients with bronchial asthma.
Sympathomimetic amines should be used with caution in patients with hypertension, ischemic heart disease, diabetes mellitus, increased intraocular pressure, hyperthyroidism and prostatic hypertrophy. Sympathomimetics may produce central nervous system stimulation with convulsions or cardiovascular collapse with accompanying hypotension.
Precautions: *Information for patients:* Antihistamines may impair mental and physical abilities required for the performance of potentially hazardous tasks, such as driving a vehicle or operating machinery. Patients should also be warned about possible additive effects with alcohol and other central nervous system depressants (hypnotics, sedatives, tranquilizers).
Drug interactions: Pseudoephedrine-containing drugs should not be given to patients treated with monoamine oxidase (MAO) inhibitors because of the possibility of precipitating a hypertensive crisis. MAO inhibitors also prolong and intensify the anticholinergic effects of antihistamines. Sympathomimetics may reduce the antihypertensive effect of methyldopa, reserpine, veratrum alkaloids and mecamylamine.
Alcohol and other sedative drugs will potentiate the sedative effects of chlorpheniramine.
Care should be taken in administering Deconamine concomitantly with other sympathomimetic amines, since their combined effects on the cardiovascular system may be harmful to the patient.
Pregnancy: Pregnancy Category C. Animal reproduction studies have not been conducted with Deconamine. It is also not known whether Deconamine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Deconamine should be given to a pregnant woman only if clearly needed.
Nursing Mothers: Due to the possible passage of pseudoephedrine and chlorpheniramine into breast milk and because of the higher than usual risk for infants from sympathomimetic amines and antihistamines, the benefit to the mother vs. the potential risk should be considered and a decision should be made whether to discontinue nursing or to discontinue the drug.
Pediatric Use: Deconamine capsules or tablets should not be given to children under 12 years of age.
Adverse Reactions: Chlorpheniramine maleate: Slight to moderate drowsiness may occur and is the most frequent side effect. Other possible side effects of antihistamines in general include:
General: urticaria, drug rash, anaphylactic shock, photosensitivity, excessive perspiration, chills, dryness of mouth, nose and throat.
Cardiovascular: hypotension, headache, palpitation, tachycardia, extrasystoles.
Hematological: hemolytic anemia, thrombocytopenia, agranulocytosis.
CNS: sedation, dizziness, disturbed coordination, fatigue, confusion, restlessness, excitation, nervousness, tremor, irritability, insomnia, euphoria, paresthesia, blurred vision, diplopia, vertigo, tinnitus, hysteria, neuritis, convulsion.
Gastrointestinal: epigastric distress, anorexia, nausea, vomiting, diarrhea, constipation.
Genitourinary: urinary frequency, difficult urination, urinary retention, early menses.
Respiratory: thickening of bronchial secretions, tightness of chest, wheezing and nasal stuffiness.
Pseudoephedrine hydrochloride: Pseudoephedrine may cause mild central nervous system stimulation especially in those patients who are hypersensitive to sympathomimetic drugs. Nervousness, excitability, restlessness, dizziness, weakness and insomnia may also occur. Headache and drowsiness have also been reported. Large doses may cause lightheadedness, nausea and/or vomiting. Sympathomimetic drugs have also been associated with certain untoward reactions including fear, anxiety, tenseness, restlessness, tremor, weakness, pallor, respiratory difficulty, dysuria, insomnia, hallucination, convulsion, CNS depression, arrhythmias and cardiovascular collapse with hypotension.
Overdosage: Acute overdosage may produce clinical signs of CNS stimulation and variable cardiovascular effects. Pressor amines should be used with great caution in the presence of pseudoephedrine. Patients with signs of stimulation should be treated conservatively.
Dosage and Administration: Adults and children over 12 years, one capsule every 12 hours. Children under 12 years, Deconamine Elixir or Syrup is recommended.
Caution: Federal law prohibits dispensing without prescription.
Deconamine® SR Capsules are manufactured for
